

# Grading systems “cut” the road instead of merely “scraping” it.

**Grading systems penetrate more easily into hard-packed gravel roads and quickly bring back embedded rock to the surface.**

Grader operators can save money by purchasing less stone and requiring fewer passes, less horsepower and less down pressure to do the job properly. The result is an improved road surface with less wear on equipment.

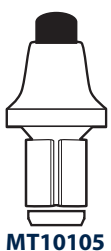

## Replace Worn Milling Tools Right on the Job

Downtime is significantly reduced as well since only the worn milling tools need to be replaced, not the entire blade and fastening hardware. Just one person can quickly install new tools in the field. No heavy lifting. No shop time. No special installation tools.

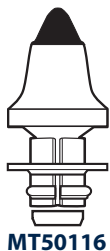

## Scarifiers Last 5x Longer than Standard Blades

These extremely hard, cost-effective carbide tip tools rotate as they cut, thus sharpening themselves as they provide a uniform wear pattern. A longer life means reduced replacement parts costs.

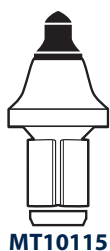

Consisting of an adapter board and milling tools, grading systems fit on all standard grader and under body blades. They will make road grader operations more efficient, more versatile and much more economical.
